🔒 Companies

Given an integer `x`, return `true` if `x` is a *palindrome*, and `false` otherwise.

Example 1:

Input: `x = 121`

Output: `true`

Explanation: 121 reads as 121 from left to right and from right to left.

Example 2:

Input: `x = -121`

Output: `false`

Explanation: From left to right, it reads -121. From right to left, it becomes 121-. Therefore it is not a palindrome.

Solution:

```
class Solution:
    def isPalindrome(self, x: int) -> bool:
        s = str(x)
        if s != s[::-1]:
            return False
        return True
```
